

# 99 Protocol

A Transparent Supply-Control System for \$OCCUPY

Star [ตาร]

<https://www.occupy.wtf>

## Abstract

Most tokens—and even traditional financial systems like stocks—operate under hidden or centralized supply controls. The 99 Protocol introduces a radically transparent method of supply control on-chain, giving the public a visible mechanism to support and participate in. \$OCCUPY is not just a meme coin. It is a protest encoded in smart contracts. A digital rebellion for the 99% against the 1%.

## 1. Introduction

The name OCCUPY is a tribute to the 2011 Occupy Wall Street movement, a global protest against economic inequality. The movement's rallying cry—"We are the 99%"—remains as relevant today as ever. In today's crypto markets, the same power imbalance persists: whales, insiders, and centralized projects dominate supply control behind closed doors.

The 99 Protocol is our answer. An open system that lets everyone see exactly how supply is being controlled. Built on the Solana blockchain for speed and transparency, it reclaims the spirit of decentralized finance—and the Occupy movement—by making price action and supply constraints visible, fair, and public.

## 2. The 99 Protocol

1. Supporters send SOL to the protocol.
2. The protocol market-buys \$OCCUPY tokens from the Liquidity Pool.
3. 99% of the purchased tokens are locked for 99 days.
4. 1% is returned to the supporter as proof of contribution.

This may seem like a loss for the contributor—but it fuels the system:

- The SOL is injected into the LP, strengthening it.
- The token supply in LP drops, raising price.
- The buy pressure is sustained.
- Supply control is publicly verifiable.

## Supply Loop

Every day, unlocked tokens are relocked for another 99 days. This creates a perpetual cycle of scarcity and price pressure without any single entity controlling the flow. The system is fully autonomous and trustless—no human or DAO decides when or how supply is released.

## 3. Fueling the System

- Perpetual Buy Pressure
- Transparent Locking
- Liquidity Injection
- Deflationary Impact

## 4. Market Cap Dynamics

Market Cap = (USD in LP / Tokens in LP) × Total Supply

As the 99 Protocol operates:

- USD in LP increases
- Tokens in LP decrease
- Token price rises naturally

## 5. Real Token Value

Most meme coins have weak liquidity and fake volume. Many tokens are technically worthless when selling due to thin order books. \$OCCUPY changes that.

- Token Value = Liquidity Depth × Scarcity × Visibility
- The 99 Protocol makes all three measurable and public.
- No dev wallets. No insiders. No backdoors.

## 6. Why It Matters

The 99 Protocol is the first protocol to treat tokenomics as activism. It replaces silent insiders with public transparency. It gives back control—not in marketing slogans—but in open code.

## 7. Roadmap

- Launch on Pump.fun
- Activate Protocol Loop
- On-Chain Analytics Dashboard
- Education Campaign: “We Are The 99%”
- Cross-chain Bridge
- OCCUPY/Real World DeFi Integrations

## 8. Join the Movement

You can buy tokens. Or you can support the system.

Help build a transparent crypto future where no one controls supply in the shadows.

We are the 99%. It's time to OCCUPY.

## Appendix

- Token Supply: 1,000,000,000
- Name: WE ARE THE 99%
- Network: Solana
- Decimals: 6
- Contract Address
  - HByPh52QJ7G5F3Ex6VwqYBJHQrrq6RW7pDHNBWMApump
- Protocol Address
  - 37yLJVc6HsovQYm7E4DaVEcejykb3a3WRRo6ajcUcVF
